Deeparture V2 - Phase 2A Acceptance Checklist

Code-Aware Revision 1.3

Use this checklist against the uploaded Phase 1 source. It tests the Phase 2A delta plus essential Phase 1 regressions.

Admin V2 URL	_____
Frontend staging URL	_____
Backend/API URL	_____
GitHub branch / commit	_____
Atlas staging DB	_____
Test date / tester	_____

1. Baseline Identity & Regression

Test	Verify	Pass	Fail	Notes
The reviewed Phase 1 working tree has been committed.	Full commit hash recorded.	[ ]	[ ]	
Render frontend/backend use the recorded commit.	Deployment revision matches the handover baseline plus Phase 2A changes.	[ ]	[ ]	
V2 staging uses a dedicated Atlas database.	Database name is documented and separate from V1 production.	[ ]	[ ]	
Phase 1 regression suite remains green.	Auth, ownership, pricing, claims, imports, public pages/search and browser checks still pass or have documented intentional replacements.	[ ]	[ ]	

2. Admin V2 Access & Layout

Test	Verify	Pass	Fail	Notes
Dedicated `/admin/v2` area exists.	It is not merely the existing operator organisation dashboard.	[ ]	[ ]	
Admin can access Admin V2.	Valid admin session works.	[ ]	[ ]	
Operator cannot access Admin V2.	Frontend and backend both reject access.	[ ]	[ ]	
Admin navigation works on desktop/tablet/phone.	No critical squeezed table/navigation layout.	[ ]	[ ]	

3. Admin Dashboard

Test	Verify	Pass	Fail	Notes
Dashboard shows liveaboard/resort totals.	Counts match database.	[ ]	[ ]	
Dashboard shows draft/pending counts.	Counts reflect moderation states.	[ ]	[ ]	
Dashboard shows unclaimed/invited/claimed organisations.	Claim-state counts are separate from listing publication states.	[ ]	[ ]	
Dashboard shows pending admin enquiries.	Links open the correct queue.	[ ]	[ ]	

4. Catalogue Moderation

Test	Verify	Pass	Fail	Notes
Admin can globally list/search/filter liveaboards.	Pagination/search/status/operator/destination filters work.	[ ]	[ ]	
Admin can globally list/search/filter resorts.	Equivalent controls work.	[ ]	[ ]	
Publication status supports draft/pending_review/published/restricted/archived.	Model/API/UI agree on statuses.	[ ]	[ ]	
Public API returns only published listings.	Pending/restricted/archived records are not public.	[ ]	[ ]	
Admin can publish/unpublish/restrict/archive.	Status changes persist and audit events are written.	[ ]	[ ]	
Imported records do not publish by default.	New catalogue imports enter draft/pending review unless explicitly approved by Admin.	[ ]	[ ]	

5. Draft & Pending Review

Test	Verify	Pass	Fail	Notes
Draft queue works.	Admin can open/edit/preview a draft.	[ ]	[ ]	
Pending-review queue works.	Admin can approve/publish or reject/archive.	[ ]	[ ]	
Basic listing can publish without current availability.	Catalogue-first model remains intact.	[ ]	[ ]	

6. Normalized Import Architecture

Test	Verify	Pass	Fail	Notes
CSV parser still works.	Existing parser remains functional as an adapter.	[ ]	[ ]	
XLSX parser still works.	XLSX remains preferred human/admin source.	[ ]	[ ]	
Source adapters map to normalized DTOs.	OrganisationImport/LiveaboardImport/ResortImport or equivalent are documented.	[ ]	[ ]	
Core import service does not depend on spreadsheet header names.	Spreadsheet-specific names stay in adapter/mapping layer.	[ ]	[ ]	
Parser/adapter does not write catalogue records directly.	Commit happens only after preview/confirmation.	[ ]	[ ]	
Standard XLSX structure is documented.	Operators/Liveaboards/Resorts sheets or documented equivalent.	[ ]	[ ]	

7. Import Preview / Commit

Test	Verify	Pass	Fail	Notes
Upload creates a no-write preview.	Database catalogue records are unchanged before confirmation.	[ ]	[ ]	
Preview classifies CREATE.	New records are identified.	[ ]	[ ]	
Preview classifies UPDATE.	Existing records are matched.	[ ]	[ ]	
Preview classifies DUPLICATE_REVIEW.	Ambiguous records are not silently merged.	[ ]	[ ]	
Preview classifies ERROR/SKIP.	Row reason is human-readable.	[ ]	[ ]	
Admin confirmation commits the batch.	Only confirmed rows write to catalogue.	[ ]	[ ]	
Batch result records row outcomes.	Batch ID + counts + row results available.	[ ]	[ ]	
Re-import preserves stable record IDs where matched.	Existing Phase 1 idempotent behaviour remains.	[ ]	[ ]	

8. Organisations & Claiming

Test	Verify	Pass	Fail	Notes
Admin can create an unclaimed operator organisation.	No operator user account is required.	[ ]	[ ]	
Same organisation can own liveaboards and resorts.	Existing shared-organisation model remains.	[ ]	[ ]	
Admin can suspend/reactivate an organisation.	Organisation state is enforced.	[ ]	[ ]	
Admin can send a single claim invitation.	Existing secure claim service is reused.	[ ]	[ ]	
Claim token remains hashed, expiring and single-use.	Phase 1 security regression passes.	[ ]	[ ]	
Claim attaches user to existing organisation.	Existing listings remain attached; no duplicate organisation is created.	[ ]	[ ]	

9. Attributes

Test	Verify	Pass	Fail	Notes
Admin can list active/inactive attribute definitions.	Admin view is not limited to public active definitions.	[ ]	[ ]	
Admin can create/edit/deactivate attributes.	Facilities/dietary/accessibility/diving can be maintained without core model rewrite.	[ ]	[ ]	
Filterable/public/applicableTo/dataType controls work.	Existing extensible model is preserved.	[ ]	[ ]	

10. Locations & Ports

Test	Verify	Pass	Fail	Notes
Admin can CRUD canonical locations.	Country/region/destination/port supported.	[ ]	[ ]	
Catalogue/itinerary can reference canonical Location IDs.	Identity is not dependent on free-text spelling.	[ ]	[ ]	
Existing slug-based search still works during transition.	Structured-reference change does not regress public search.	[ ]	[ ]	
Aliases/case variants do not create accidental duplicate filters.	Canonical matching/validation works.	[ ]	[ ]	

11. Admin-First Enquiry Workflow

Test	Verify	Pass	Fail	Notes
New customer enquiry persists as pending Admin review.	It is not immediately marked `sent_to_operator`.	[ ]	[ ]	
Customer acknowledgement is sent/generated.	Staging-safe transport.	[ ]	[ ]	
Admin receives notification/queue item.	Operator has not yet received the enquiry.	[ ]	[ ]	
Admin can approve enquiry.	Valid state transition is persisted.	[ ]	[ ]	
Operator is notified only after Admin approval.	Correct organisation recipients.	[ ]	[ ]	
Email failure does not lose the enquiry record.	Persistence remains authoritative.	[ ]	[ ]	
Admin can reject/spam/close as configured.	Invalid state jumps are prevented.	[ ]	[ ]	

12. Normalized Availability Service

Test	Verify	Pass	Fail	Notes
A documented Availability Service exists.	Manual/import code does not own separate availability business logic.	[ ]	[ ]	
Normalized availability-update contract exists.	IDs, status/quantity, source and timestamps are defined.	[ ]	[ ]	
Liveaboard availability import routes through the service.	`inventoryImport.service.js` no longer directly owns final availability write logic.	[ ]	[ ]	
Manual departure availability routes through the service.	`inventory.controller.js` delegates to common service.	[ ]	[ ]	
Resort availability routes through the service.	Direct model upsert is moved behind the service boundary.	[ ]	[ ]	
Stable liveaboard inventory upsert works.	Same departure+cabin update modifies the intended inventory rather than creating duplicates.	[ ]	[ ]	
Source type and update timestamps are returned.	Effective inventory can state where/when it was updated.	[ ]	[ ]	
Search/public consumer uses effective availability.	Consumer need not know if source was Admin/CSV/XLSX.	[ ]	[ ]	
Availability is not labelled live solely because a value exists.	Future freshness semantics remain possible.	[ ]	[ ]	

13. Audit & Email Regression

Test	Verify	Pass	Fail	Notes
Moderation actions create audit records.	Publish/restrict/archive tracked.	[ ]	[ ]	
Import commit creates audit record.	Batch identity included where appropriate.	[ ]	[ ]	
Enquiry approval/rejection creates audit record.	Actor/action/entity/time visible.	[ ]	[ ]	
No passwords/raw claim tokens/secrets enter audit payloads.	Security review passes.	[ ]	[ ]	
Existing safe email transport remains functional.	Test-mode regression passes.	[ ]	[ ]	

14. Mobile / Responsive

Test	Verify	Pass	Fail	Notes
Admin dashboard usable on phone.	No critical horizontal squeeze.	[ ]	[ ]	
Catalogue moderation usable on phone.	Publish/restrict actions are touch-friendly.	[ ]	[ ]	
Enquiry approval usable on phone.	No hover-only control.	[ ]	[ ]	
Import preview usable at least on desktop/tablet.	Mobile may be simplified, but no broken page.	[ ]	[ ]	

15. End-to-End Phase 2A Demonstration

Test	Verify	Pass	Fail	Notes
Create/import an unclaimed organisation.		[ ]	[ ]	
Upload one liveaboard and one resort.		[ ]	[ ]	
See preview before database commit.		[ ]	[ ]	
Confirm import and receive batch result.		[ ]	[ ]	
Records enter draft/pending review, not public by default.		[ ]	[ ]	
Admin reviews and publishes both.		[ ]	[ ]	
Automatic public pages appear.		[ ]	[ ]	
Send claim invitation and claim existing organisation.		[ ]	[ ]	
No duplicate organisation/listing is created.		[ ]	[ ]	
Submit customer enquiry; confirm Admin receives it before operator.		[ ]	[ ]	
Admin approves; operator then receives it.		[ ]	[ ]	
Update a test departure through Availability Service.		[ ]	[ ]	
Repeat same inventory update; confirm stable upsert.		[ ]	[ ]	
Public/API response includes effective availability source/update metadata.		[ ]	[ ]	
Phase 1 pricing/claim/search/public-page regressions remain green.		[ ]	[ ]	
PASS - Phase 2A accepted		[ ]	[ ]	
PASS WITH ISSUES - non-critical issues documented		[ ]	[ ]	
FAIL - Phase 2A not ready for Phase 2B		[ ]	[ ]	

Final Result

[ ]	PASS - Phase 2A accepted
[ ]	PASS WITH ISSUES - non-critical issues documented
[ ]	FAIL - Phase 2A not ready for Phase 2B
